                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human adrenomedullin (AM) peptides P070, P071, P072 and PAMP-20
were used for the production of anti-AM antibodies (Ab). P070 represents
preproAM amino acids (aa) 34-41 with the sequence Tyr-Tyr attached at
the N-terminus, P071 represents preproAM aa 122-131 with the sequence
Tyr-Gly-Gly attached at the N-terminus, P072 represents preproAM aa

Tyr-Gly-Gly attached at the N-terminus, P072 represents preproAM ac

116-146 and PAMP-20 represents the proAM N-terminus. The Ab are useful
for the prevention and/or treatment of cancers, e.g. adrenal, nervous
system, lung, colon, ovarian and breast cancer by inhibiting cell
for the prevention and therefore for treating and/or preventing diabetes
system, lung, colon, ovarian and breast cancer by inhibiting cell
flowers metabolism and therefore for treating and/or preventing diabetes
type II. They may be used for the diagnosis or treatment of conditions
to predict the following: (i) regulating neurotransmission or neuron growth in
areas of the central nervous system; (ii) lessening or inhibiting mast
cell degranulation and hence reducing the effects of an allergic
response, (iii) inhibiting or preventing bacterial and fungal growth (to
creat and hence reducing the effects of an allergic
creat and hence and an enventing bacterial and fungal growth (to
creat and hence and and process the second or promoting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinindly) and malelmido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide components to form a component of the amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treament of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the hody.

Wodifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life and specificity as bonding to large molecules decreases that intracellular uptake and interference with physiological processes.

AMB90829 to AAB92441 represent invention.
Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vasoactive peptides useful for inhibiting calcitonin gene related

comprising a therapeutically active amino acid region [III] and a reactive group [II] (e.g. succinimidyl and maleimido groups) attached to a leactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region [IV], which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half infracellular uptake and interference with physiological processes. ARB908129 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protection, endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a modified therapeutic peptide (I)

The method comprises: (a) producing the fused protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedullin precursor. The method can be used for the production of adrenomedullin precursor for pharmaceutical and diagnostic applications. AAH19806 to AAH19666 and AAB75110 to AAB75124 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Producing adrenomedullin useful for pharmaceutical and diagnostic application comprises producing fused adrenomedullin precursor using a recombinant host -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Adrenomedullin; glycine extended adrenomedullin; AM; AM-gly; adrenomedullin precursor; fusion protein; pharmaceutical; diagnostic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                    The invention relates to antagonists of the vasoactive peptide calcitonin gene related peptide (CGRP) and other members of the CGRP superfamily. The invention also relates to amino the terminal modifications of peptides to improve their ability to bind to a member of the CGRP-receptor super-family. CGRP antagonists are used for inhibiting CGRP activity which can be used in vitro e.g. in assays to identify and/or isolate CGRP receptors or with intercells either in vitro or in vivo to inhibit the effect of CGRP adrenomedullin peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                              The invention relates to antagonists of the vasoactive peptide calcitonin gene related peptide (CGRP) and other members of the CGRP superfamily. The invention also relates to amino the terminal modifications of peptides to improve their ability to bind to a nember of the CGRP receptor super-family. CGRP antagonists are used for inhibiting CGRP activity which can be used in vitro e.g. in assays to identify and/or isolate CGRP receptors or with intact calls either in vitro or in vivo to inhibit the effect of CGRP binding to its receptor. The present sequence is human adrenomedullin peptide.
                                                                                                                     Human; vasoactive peptide; calcitonin gene related peptide; CGRP; CGRP-receptor identification; adrenomedullin.
                                                                                                                                                                                                                                                                                      Vascactive peptides useful for inhibiting calcitonin gene related

The present sequence is that of human adrenomedullin, a potent hypotensive and vasodilator. The invention provides modified calcitonin and related peptides, such as adrenomedullin, that have at least 70% identify to the native form but are modified such that the tendency of the peptide to aggregate is reduced. Preferred regions for modification include those for which the peptide is polymorphic amongst different species, which increase the propensity of the peptide to form local interactions of the peptides or increase the net charge of the peptide. When aggregation is reduced to prevented, lower doses of the drug can aggregation is reduced to prevented, lower doses of the drug can be used. Side-effects and undesired responses are minimised by retaining high sequence identity to the human peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                  and advanced to the production describes a method (M1) for producing development of a direnomedullin precursor. The method comprises: (a) producing the fused protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedullin precursor. The method can be used for the production of adrenomedullin precursor for pharmaceutical and diagnostic applications, AAN19806 to AAN19806 and AAN75110 to AAN75124 represent sequences which are used in the exemplification of the present invention.

The fusion protein is cleavable by a protease. The fusion peptide of the invention is useful for the efficient large scale production of peptides. The present amino acid sequence represents a protein that was used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fusion polypeptide of Escherichia coli universal stress peptide with a target peptide, useful for efficient large scale production of the target peptide comprising expression of the fusion polypeptide followed
protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedullin precursor. The method can be used for the production of adrenomedullin precursor for pharmaceutical and diagnostic applications. AAH19806 to AAH19866 and AAB75110 to AAB75124 repersent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fusion peptide; universal stress peptide; UspA; linker peptide;

The present invention describes a method (M1) for producing adrenomedullin precursor. The method comprises: (a) producing the fused protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedullin precursor. The method can be used for the production of adrenomedullin precursor for pharmaceutical and diagnostic applications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method (MI) for producing adrenomedullin precursor. The method comprises: (a) producing the fused protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedullin precursor. The method can be used for the production of adrenomedullin precursor for pharmaceutical and diagnostic applications. AAH19806 to AAH19866 and AAB75110 to AAB75124 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Producing adrenomedullin useful for pharmaceutical and diagnostic application comprises producing fused adrenomedullin precursor using a recombinant host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises a novel fusion peptide which contains an Escherichia coli universal stress protein (UspA), a linker peptide and a target peptide. The fusion protein is cleavable by a protease. The fusion peptide of the invention is useful for the efficient large scale production of peptides. The present amino acid sequence represents a protein that was used in the invention.
                                                                                          The present invention describes a method (MI) for producing adrenomedulin precursor. The method comprises: (a) producing the fused protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedulin precursor. The method can be used for the production of adrenomedulin precursor for pharmaceutical and diagnostic applications, AAH19806 to AAH19866 and AAB75110 to AAB75124 represent sequences which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Fusion polypeptide of Escherichia coli universal stress peptide with a target peptide, useful for efficient large scale production of the target peptide comprising expression of the fusion polypeptide followed
                     Producing adrenomedullin useful for pharmaceutical and diagnostic application comprises producing fused adrenomedullin precursor using a recombinant host \dot{\,}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises a novel fusion peptide which contains an Escherichia coli universal stress protein (UspA), a linker peptide and a target peptide. The fusion protein is cleavable by a protease. The fusion peptide of the invention is useful for the efficient large scale production of peptides. The present amino acid sequence represents a protein that was used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fusion polypeptide of Escherichia coli universal stress peptide with a target peptide, useful for efficient large scale production of the target peptide comprising expression of the fusion polypeptide followed

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Biochem: Biophys: Res Commun. 195, 921-927, 1993
A; Title: Molecular cloning and biological activities of rat adrenomedullin, a hypotensiv
A; Reference number: JN0766; MUID:93384621; PMID:7690563
A; Molecule type: mRNA
A; Residues: 1-186 SAK>
A; Accession: PN0610
A; Molecule type: protein
A; Residues: 22-41
C; Comment: This precursor contains a unique 20-amino acid sequence designated proadrenomedullin A; Residues: 22-41
C; Comment: This precursor contains a unique 20-amino acid sequence designated proadrenomedullin A; Residues: 22-41
C; Comment: Signal sequence #status predicted <PEU>F; 22-41/Product: proadrenomedullin maino-terminal 20 peptide #status predicted <PEU>F; 22-41/Product: proadrenomedullin #status predicted <AMAT>F; 24-1/Product: adrenomedullin #status predicted <AMAT>F; 24-1/Product: adrenomedullin #status predicted <AMAT>F; 24-1/Product: amidated carboxyl end (Tyr) (amide in mature form from following gly F; 143/Modified site: amidated carboxyl end (Tyr) (amide in mature form from following gly F; 143/Modified site: amidated carboxyl end (Tyr) (amide in mature form from following gly

                                                                                                                                                                                                                                                         -1- FUNCTION: AM AND PAMP ARE POTENT HYPOTENSIVE AND VASODILATATOR AGENTS. NUMBEROUS ACTIONS HAVE BEEN REPORTED MOST RELATED TO THE PHYSIOLOGIC CONTROL OF FULID AND ELECTROLYTE HOMOSTASIS. IN THE KIDNEY, AM IS DIURETIC AND NATRIURETIC, AND BOTH AM AND PAMP INHIBIT ALDOSTERONE SECRETION BY DIRECT ADRENAL ACTIONS. IN PITILITARY GLAND, BOTH PEPTIDES AT PHYSIOLOGICALLY RELEVANT DOSES INHIBIT BASAL ACTH SECRETION. BOTH PEPTIDES APPEAR TO ACT IN BRAIN AND PITUITARY GLAND TO FACILITATE THE LOSS OF PLASMA VOLUME, ACTIONS WHICH COMPLEMENT THEIR HYPOTENSIVE EFFECTS IN BLOOD
                                                                                                                                                                                        MEDITINE=20053666, PubMed-10588445;

GENERAL INFORMATION:
APPLICANT: Moll, Gert N.
APPLICANT: Leenhouts, Cornells J.
TITLE OF INVENTION: Export and modification of (poly)peptide in the lantibiotic way
FILE REFERENCE: 2183-5673
CURRENT APPLICATION NUMBER: US/10/360,101
CURRENT FILING DATE: 2003-02-07
PRIOR APPLICATION NUMBER: EP 02077060.8
PRIOR FILING DATE: 2002-05-24
NUMBER OF SEQ ID NOS: 309
SOFTWARE: Patentin version 3.1
SEQ ID NO 74
LENGTH: 52
